

# The Heisenberg Category

**Raj Gandhi**

University of Ottawa

August 7, 2018

## Definition

A *category*,  $\mathcal{C}$ , consists of

- ▶ A class of *objects*, denoted  $Ob(\mathcal{C})$
- ▶ A class of *morphisms* between the objects of  $\mathcal{C}$ . If  $X, Y \in Ob(\mathcal{C})$ , then we denote the class of morphisms from  $X$  to  $Y$  by  $Hom_{\mathcal{C}}(X, Y)$
- ▶ We can compose morphisms whenever it makes sense. Composition of  $f$  and  $g$  is denoted  $f \circ g$  (if this makes sense).

Additionally, we impose the following relations:

- ▶ (*associativity*): whenever compositions of morphisms make sense, we have  $f \circ (g \circ h) = (f \circ g) \circ h$
- ▶ (*identity*) for any object  $x \in \mathcal{C}$ , there is a morphism  $1_x : x \rightarrow x$  such that for any morphism  $f : x \rightarrow y$  and  $g : a \rightarrow x$  in  $\mathcal{C}$ , we have  $1_x \circ g = g$  and  $f \circ 1_x = f$ .

## Example

The category **Set** is the category whose objects are sets and whose morphisms are functions between sets. Composition of morphisms is defined as the composition of functions.

## Example

The category  **$\mathbb{k}$ -Vect** is the category whose objects are vector spaces over a fixed field  $\mathbb{k}$  and whose morphisms are linear transformations between these vector spaces. Composition of morphisms is defined as composition of linear transformations.

## Example

The category **Ring** is the category whose objects are rings and whose morphisms are ring homomorphisms. Composition of morphisms is defined as composition of ring homomorphisms.

## Example

The category **Set** is the category whose objects are sets and whose morphisms are functions between sets. Composition of morphisms is defined as the composition of functions.

## Example

The category  $\mathbb{k}\text{-Vect}$  is the category whose objects are vector spaces over a fixed field  $\mathbb{k}$  and whose morphisms are linear transformations between these vector spaces. Composition of morphisms is defined as composition of linear transformations.

## Example

The category **Ring** is the category whose objects are rings and whose morphisms are ring homomorphisms. Composition of morphisms is defined as composition of ring homomorphisms.

## Example

The category **Ring** is the category whose objects are rings and whose morphisms are ring homomorphisms. Composition of morphisms is defined as composition of ring homomorphisms.

# Strict $\mathbb{k}$ -Linear Monoidal Category

## Definition

A *strict monoidal category* is a category  $\mathcal{C}$  together with

- ▶ a bifunctor  $\otimes : \mathcal{C} \times \mathcal{C} \rightarrow \mathcal{C}$ , and
- ▶ a unit object  $\mathbf{1}$ ,

such that for all  $A, B, C \in \text{Ob}(\mathcal{C})$ ,

- ▶  $(A \otimes B) \otimes C = A \otimes (B \otimes C)$ , and
- ▶  $\mathbf{1} \otimes A = A = A \otimes \mathbf{1}$

## Definition

Let  $\mathbb{k}$  be a commutative ring. A *strict  $\mathbb{k}$ -linear monoidal category* is a strict monoidal category such that

- ▶ each morphism space is a  $\mathbb{k}$ -module, and
- ▶ composition of morphisms is  $\mathbb{k}$ -linear.

# Strict $\mathbb{k}$ -Linear Monoidal Category

## Definition

A *strict monoidal category* is a category  $\mathcal{C}$  together with

- ▶ a bifunctor  $\otimes : \mathcal{C} \times \mathcal{C} \rightarrow \mathcal{C}$ , and
- ▶ a unit object  $\mathbf{1}$ ,

such that for all  $A, B, C \in \text{Ob}(\mathcal{C})$ ,

- ▶  $(A \otimes B) \otimes C = A \otimes (B \otimes C)$ , and
- ▶  $\mathbf{1} \otimes A = A = A \otimes \mathbf{1}$

## Definition

Let  $\mathbb{k}$  be a commutative ring. A *strict  $\mathbb{k}$ -linear monoidal category* is a strict monoidal category such that

- ▶ each morphism space is a  $\mathbb{k}$ -module, and
- ▶ composition of morphisms is  $\mathbb{k}$ -linear.

# Strict $\mathbb{k}$ -Linear Monoidal Category

## Definition

A *strict monoidal category* is a category  $\mathcal{C}$  together with

- ▶ each morphism space is a  $\mathbb{k}$ -module, and
- ▶ composition of morphisms is  $\mathbb{k}$ -linear.

# Strict Monoidal Categories

## Example

The category of sets, **Set**, is a monoidal category with the Cartesian product as the bifunctor and any one-element set as the unit object.

## Example

The category of vector spaces over a fixed field  $\mathbb{k}$ ,  **$\mathbb{k}$ -Vect**, is a monoidal category with the usual tensor product, and the field  $\mathbb{k}$  serving as the unit object.

## Example

The category of endofunctors from a category  $\mathcal{C}$  to itself is a *strict* monoidal category with composition of functors as the tensor product, and the identity functor as the unit object.

# Strict Monoidal Categories

## Example

The category of sets, **Set**, is a monoidal category with the Cartesian product as the bifunctor and any one-element set as the unit object.

## Example

The category of vector spaces over a fixed field  $\mathbb{k}$ ,  **$\mathbb{k}$ -Vect**, is a monoidal category with the usual tensor product, and the field  $\mathbb{k}$  serving as the unit object.

## Example

# String Diagrams 1

Let  $\mathcal{C}$  be a strict monoidal category. We denote a morphism  $f : X \rightarrow Y$  in  $\mathcal{C}$  by the diagram

$$\begin{array}{c} Y \\ \uparrow \\ \bullet f : X \rightarrow Y. \\ \downarrow \\ X \end{array}$$

The identity on  $X$  is given by a morphism

$$\begin{array}{c} X \\ \uparrow \\ \phantom{\bullet} : X \rightarrow X. \\ \downarrow \\ X \end{array}$$

Additionally, we may write morphisms  $f : \mathbf{1} \rightarrow X \otimes Y$  and  $g : X \otimes Y \rightarrow \mathbf{1}$  as

$$\begin{array}{c} \cup \\ \bullet \\ f \end{array} : \mathbf{1} \rightarrow X \otimes Y, \quad \begin{array}{c} \bullet \\ \cap \\ g \end{array} : X \otimes Y \rightarrow \mathbf{1}.$$

# String Diagrams 1

Let  $\mathcal{C}$  be a strict monoidal category. We denote a morphism  $f : X \rightarrow Y$  in  $\mathcal{C}$  by the diagram

$$\begin{array}{c} Y \\ \uparrow \\ \bullet f : X \rightarrow Y. \\ \downarrow \\ X \end{array}$$

The identity on  $X$  is given by a morphism

$$\begin{array}{c} X \\ \uparrow \\ \phantom{\bullet} : X \rightarrow X. \\ \downarrow \\ X \end{array}$$

Additionally, we may write morphisms  $f : \mathbf{1} \rightarrow X \otimes Y$  and  $g : X \otimes Y \rightarrow \mathbf{1}$  as

$$\begin{array}{c} \cup \\ \bullet \\ f \\ \cap \end{array} : \mathbf{1} \rightarrow X \otimes Y, \quad \begin{array}{c} \bullet \\ g \\ \cup \end{array} : X \otimes Y \rightarrow \mathbf{1}.$$

# String Diagrams 1

$$\begin{array}{c} Y \\ \uparrow \\ \bullet \\ \downarrow \\ X \end{array} f : X \rightarrow Y.$$

The identity on  $X$  is given by a morphism

$$\begin{array}{c} X \\ \uparrow \\ \bullet \\ \downarrow \\ X \end{array} : X \rightarrow X.$$

Additionally, we may write morphisms  $f : \mathbf{1} \rightarrow X \otimes Y$  and  $g : X \otimes Y \rightarrow \mathbf{1}$  as

$$\begin{array}{c} \cup \\ \bullet \\ \downarrow \\ f \end{array} : \mathbf{1} \rightarrow X \otimes Y, \quad \begin{array}{c} \cap \\ \bullet \\ \downarrow \\ g \end{array} : X \otimes Y \rightarrow \mathbf{1}.$$

## String Diagram 2

We compose morphisms vertically, and we tensor morphisms horizontally. So, if  $f : X \rightarrow Y$ ,  $g : Y \rightarrow Z$ , and  $h : A \rightarrow B$ , we write

$$\begin{array}{c} Z \\ \uparrow \\ \bullet \\ \uparrow \\ f \bullet \\ | \\ X \end{array} g = \begin{array}{c} Z \\ \uparrow \\ \bullet \\ | \\ X \end{array} g \circ f$$
$$\begin{array}{c} Y \\ \uparrow \\ f \bullet \\ | \\ X \end{array} \otimes \begin{array}{c} B \\ \uparrow \\ \bullet \\ | \\ A \end{array} h = \begin{array}{c} Y \\ \uparrow \\ f \bullet \\ | \\ X \end{array} \begin{array}{c} B \\ \uparrow \\ \bullet \\ | \\ A \end{array} h$$

Additionally, we may write a morphism  $f : X \otimes Y \rightarrow A \otimes B$  as

## String Diagram 2

We compose morphisms vertically, and we tensor morphisms horizontally. So, if  $f : X \rightarrow Y$ ,  $g : Y \rightarrow Z$ , and  $h : A \rightarrow B$ , we write

$$\begin{array}{c} Z \\ \uparrow \\ \bullet \\ \uparrow \\ f \bullet \\ | \\ X \end{array} g = \begin{array}{c} Z \\ \uparrow \\ \bullet \\ | \\ X \end{array} g \circ f$$
$$\begin{array}{c} Y \\ \uparrow \\ f \bullet \\ | \\ X \end{array} \otimes \begin{array}{c} B \\ \uparrow \\ \bullet \\ | \\ A \end{array} h = \begin{array}{c} Y \\ \uparrow \\ f \bullet \\ | \\ X \end{array} \begin{array}{c} B \\ \uparrow \\ \bullet \\ | \\ A \end{array} h$$

Additionally, we may write a morphism  $f : X \otimes Y \rightarrow A \otimes B$  as

$$\begin{array}{ccc} & A & B \\ & \swarrow & \nearrow \\ & \bullet & \\ & \nwarrow & \searrow \\ X & & Y \end{array} f$$

# Example

Consider a strict  $\mathbb{k}$ -linear monoidal category,  $\mathcal{S}$ , defined as follows. The objects of  $\mathcal{S}$  are generated by a single object,  $Q_+$ . That is, the objects are  $\mathbf{1}, Q_+, Q_+Q_+, \dots$ , where juxtaposition denotes tensor product. The morphisms are generated by

$$\begin{array}{c} \nearrow \\ \searrow \\ \swarrow \\ \searrow \end{array} : Q_+Q_+ \rightarrow Q_+Q_+$$

and are subject to the relations

$$\begin{array}{c} \nearrow \\ \searrow \\ \swarrow \\ \searrow \end{array} = \begin{array}{c} \uparrow \\ \uparrow \end{array} \quad (1) \quad \begin{array}{c} \nearrow \\ \searrow \\ \swarrow \\ \searrow \end{array} = \begin{array}{c} \nearrow \\ \searrow \\ \swarrow \\ \searrow \end{array} \quad (2)$$

Then

$$\text{End}_{\mathcal{S}}(Q_+^{\otimes n}) = \mathbb{k}S_n,$$

where  $S_n$  is the symmetric group on  $n$  letters.

# Example

Consider a strict  $\mathbb{k}$ -linear monoidal category,  $\mathcal{S}$ , defined as follows. The objects of  $\mathcal{S}$  are generated by a single object,  $Q_+$ . That is, the objects are  $\mathbf{1}, Q_+, Q_+Q_+, \dots$ , where juxtaposition denotes tensor product. The morphisms are generated by

$$\begin{array}{c} \nearrow \\ \times \\ \searrow \end{array} : Q_+Q_+ \rightarrow Q_+Q_+$$

and are subject to the relations

$$\begin{array}{c} \nearrow \\ \text{loop} \\ \searrow \end{array} = \begin{array}{c} \uparrow \\ \uparrow \end{array} \quad (1) \quad \begin{array}{c} \nearrow \\ \text{loop} \\ \searrow \end{array} = \begin{array}{c} \nearrow \\ \searrow \end{array} \quad (2)$$

Then

$$\text{End}_{\mathcal{S}}(Q_+^{\otimes n}) = \mathbb{k}S_n,$$

where  $S_n$  is the symmetric group on  $n$  letters.

# Example

Consider a strict  $\mathbb{k}$ -linear monoidal category,  $\mathcal{S}$ , defined as follows. The objects of  $\mathcal{S}$  are generated by a single object,  $Q_+$ . That is, the objects are  $\mathbf{1}, Q_+, Q_+Q_+, \dots$ , where juxtaposition denotes tensor product. The morphisms are generated by

$$\begin{array}{c} \nearrow \\ \times \\ \searrow \end{array} : Q_+Q_+ \rightarrow Q_+Q_+$$

and are subject to the relations

$$\begin{array}{c} \nearrow \\ \text{loop} \\ \searrow \end{array} = \begin{array}{c} \uparrow \\ \uparrow \end{array} \quad (1) \quad \begin{array}{c} \nearrow \\ \text{loop} \\ \searrow \end{array} = \begin{array}{c} \nearrow \\ \searrow \end{array} \quad (2)$$

Then

$$\text{End}_{\mathcal{S}}(Q_+^{\otimes n}) = \mathbb{k}S_n,$$

where  $S_n$  is the symmetric group on  $n$  letters.

# The Heisenberg Category

## Definition

The category  $\mathcal{H}'$  is the strict  $\mathbb{k}$ -linear monoidal category defined as follows. The objects are generated by objects  $Q_+$  and  $Q_-$ , where we use juxtaposition to denote tensor product. For example,  $Q_+Q_-$  means  $Q_+ \otimes Q_-$ . The morphisms are generated by

$$\begin{array}{c} \begin{array}{c} \nearrow \searrow \\ \nwarrow \nearrow \end{array} : Q_+Q_+ \rightarrow Q_+Q_+, \quad \cup : \mathbf{1} \rightarrow Q_-Q_+ \\ \cap : Q_+Q_- \rightarrow \mathbf{1} \quad \cup : \mathbf{1} \rightarrow Q_+Q_-, \quad \cap : Q_-Q_+ \rightarrow \mathbf{1}. \end{array}$$

We let

$$\begin{array}{c} \uparrow = \text{id}_{Q_+}, \quad \downarrow = \text{id}_{Q_-}. \end{array}$$

The morphisms above are subject to certain relations, provided in the following slide.

- ▶ morphisms

$$f : \bigoplus_{i=1}^n X_i \rightarrow \bigoplus_{j=1}^m Y_j$$

are  $m \times n$  matrices whose  $(j, i)$ -entry is a morphism

$$f_{i,j} : X_i \rightarrow Y_j.$$

Composition of morphisms is given by matrix multiplication.

# Isomorphism

Consider the morphism

$$\left[ \begin{array}{c} \text{X} \\ \text{cap} \end{array} \right]^T : Q_- Q_+ \rightarrow Q_+ Q_- \oplus \mathbf{1}. \quad (11)$$

We claim that

$$\left[ \begin{array}{c} \text{X} \\ \text{cup} \end{array} \right] = \left( \left[ \begin{array}{c} \text{X} \\ \text{cap} \end{array} \right]^T \right)^{-1} : Q_+ Q_- \oplus \mathbf{1} \rightarrow Q_- Q_+ \quad (12)$$

Composing matrices in one direction gives the following relation, which must hold in  $\mathcal{H}'$ :

$$\left[ \begin{array}{c} \downarrow \\ \uparrow \end{array} \right] = \left[ \begin{array}{c} \text{X} \\ \text{X} \end{array} \right] + \left[ \begin{array}{c} \text{cup} \\ \text{cap} \end{array} \right]. \quad (13)$$

The relation (13) follows from the definition of  $\mathcal{H}'$ .

# Isomorphism

Consider the morphism

$$\left[ \begin{array}{c} \text{X} \\ \text{cap} \end{array} \right]^T : Q_- Q_+ \rightarrow Q_+ Q_- \oplus \mathbf{1}. \quad (11)$$

We claim that

$$\left[ \begin{array}{c} \text{X} \\ \text{cup} \end{array} \right] = \left( \left[ \begin{array}{c} \text{X} \\ \text{cap} \end{array} \right]^T \right)^{-1} : Q_+ Q_- \oplus \mathbf{1} \rightarrow Q_- Q_+ \quad (12)$$

Composing matrices in one direction gives the following relation, which must hold in  $\mathcal{H}'$ :

$$\begin{array}{c} \downarrow \\ \uparrow \end{array} = \begin{array}{c} \text{X} \\ \text{cup} \end{array} + \begin{array}{c} \text{cup} \\ \text{cap} \end{array}. \quad (13)$$

The relation (13) follows from the definition of  $\mathcal{H}'$ .

# Isomorphism

Consider the morphism

$$\left[ \begin{array}{c} \text{X} \\ \text{cap} \end{array} \right]^T : Q_- Q_+ \rightarrow Q_+ Q_- \oplus \mathbf{1}. \quad (11)$$

We claim that

$$\left[ \begin{array}{c} \text{X} \\ \text{cup} \end{array} \right] = \left( \left[ \begin{array}{c} \text{X} \\ \text{cap} \end{array} \right]^T \right)^{-1} : Q_+ Q_- \oplus \mathbf{1} \rightarrow Q_- Q_+ \quad (12)$$

Composing matrices in one direction gives the following relation, which must hold in  $\mathcal{H}'$ :

$$\begin{array}{c} \downarrow \\ \uparrow \end{array} = \begin{array}{c} \text{X} \\ \text{X} \end{array} + \begin{array}{c} \text{cup} \\ \text{cap} \end{array}. \quad (13)$$

The relation (13) follows from the definition of  $\mathcal{H}'$ .

# Isomorphism

Composing in the other direction, we must have also have

$$\begin{array}{c} \uparrow \\ \downarrow \end{array} = \begin{array}{c} \nearrow \\ \searrow \end{array} \quad (14)$$

$$\begin{array}{c} \circlearrowleft \\ \searrow \end{array} = 0, \quad (16)$$

$$\begin{array}{c} \nearrow \\ \circlearrowright \end{array} = 0, \quad (15)$$

$$\begin{array}{c} \circlearrowright \end{array} = \text{id}_{\mathbf{1}}, \quad (17)$$

The relations (14) and (17) follow from the definition of  $\mathcal{H}'$ . The relation (15) follows from the calculation

$$\begin{array}{c} \nearrow \\ \circlearrowright \end{array} = \begin{array}{c} \nearrow \\ \circlearrowright \end{array} = 0.$$

The relation (16) follows from a similar calculation.

# Isomorphism

Composing in the other direction, we must have also have

$$\begin{array}{c} \uparrow \\ \downarrow \end{array} = \begin{array}{c} \nearrow \\ \searrow \end{array} \quad (14)$$

$$\begin{array}{c} \nearrow \\ \searrow \end{array} = 0, \quad (15)$$

$$\begin{array}{c} \circlearrowleft \\ \searrow \end{array} = 0, \quad (16)$$

$$\begin{array}{c} \circlearrowleft \end{array} = \text{id}_{\mathbf{1}}, \quad (17)$$

The relations (14) and (17) follow from the definition of  $\mathcal{H}'$ . The relation (15) follows from the calculation

$$\begin{array}{c} \nearrow \\ \searrow \end{array} = \begin{array}{c} \nearrow \\ \searrow \end{array} \circ \begin{array}{c} \circlearrowleft \end{array} = 0.$$

The relation (16) follows from a similar calculation.

# Isomorphism

Composing in the other direction, we must have also have

$$\begin{array}{c} \uparrow \\ \downarrow \end{array} = \begin{array}{c} \nearrow \\ \searrow \\ \swarrow \\ \searrow \end{array} \quad (14)$$

$$\begin{array}{c} \nearrow \\ \searrow \\ \swarrow \\ \searrow \end{array} = 0, \quad (15)$$

$$\begin{array}{c} \uparrow \\ \downarrow \\ \uparrow \\ \downarrow \end{array} = 0, \quad (16)$$

$$\begin{array}{c} \circlearrowleft \end{array} = \text{id}_{\mathbf{1}}, \quad (17)$$

The relations (14) and (17) follow from the definition of  $\mathcal{H}'$ . The relation (15) follows from the calculation

$$\begin{array}{c} \nearrow \\ \searrow \\ \swarrow \\ \searrow \end{array} = \begin{array}{c} \nearrow \\ \searrow \\ \swarrow \\ \searrow \end{array} = 0.$$

The relation (16) follows from a similar calculation.

# The Heisenberg Algebra

## Definition

The one-variable Heisenberg algebra is the associative unital  $\mathbb{C}$ -algebra with generators  $p$  and  $q$  subject to the *canonical commutation relation*:

$$\mathbf{pq = qp + \mathbf{1}.$$

Recall the isomorphism in the additive envelope of  $\mathcal{H}'$ :

$$Q_- Q_+ \cong Q_+ Q_- \oplus \mathbf{1}.$$

It is conjectured that the "additive Karoubi envelope" of  $\mathcal{H}'$  *categorifies* the Heisenberg algebra.
