## Root systems

Let $V=\mathbb{R}^{n}$, and let $(\cdot, \cdot)$ be the standard inner product on $V$. For any $\alpha \in V$, the reflection across $\alpha$ is the linear operator $s_{\alpha}$ defined by the formula

$$
s_{\alpha}(v)=v-2 \frac{(\alpha, v)}{(\alpha, \alpha)} \alpha, \quad v \in V
$$

## Root systems

Let $V=\mathbb{R}^{n}$, and let $(\cdot, \cdot)$ be the standard inner product on $V$. For any $\alpha \in V$, the reflection across $\alpha$ is the linear operator $s_{\alpha}$ defined by the formula

$$
s_{\alpha}(v)=v-2 \frac{(\alpha, v)}{(\alpha, \alpha)} \alpha, \quad v \in V
$$

## Definition

A root system $\Sigma$ in $V$ is a finite set of nonzero vectors in $V$ satisfying the conditions:
(1) $\Sigma \cap \mathbb{R} \alpha=\{\alpha,-\alpha\}$ for all $\alpha \in \Sigma$;
(2) $s_{\alpha}(\Sigma)=\Sigma$ for all $\alpha \in \Sigma$;
(3) The roots $\alpha \in \Sigma$ generate $V$.

Note: given $\alpha, \beta \in \Sigma$, we do not require that $s_{\alpha}(\beta)=\beta-n \alpha$ for some $n \in \mathbb{Z}$.

## Root systems

Let $V=\mathbb{R}^{n}$, and let $(\cdot, \cdot)$ be the standard inner product on $V$. For any $\alpha \in V$, the reflection across $\alpha$ is the linear operator $s_{\alpha}$ defined by the formula

$$
s_{\alpha}(v)=v-2 \frac{(\alpha, v)}{(\alpha, \alpha)} \alpha, \quad v \in V
$$

## Definition

A root system $\Sigma$ in $V$ is a finite set of nonzero vectors in $V$ satisfying the conditions:
(1) $\Sigma \cap \mathbb{R} \alpha=\{\alpha,-\alpha\}$ for all $\alpha \in \Sigma$;
(2) $s_{\alpha}(\Sigma)=\Sigma$ for all $\alpha \in \Sigma$;
(3) The roots $\alpha \in \Sigma$ generate $V$.

Note: given $\alpha, \beta \in \Sigma$, we do not require that $s_{\alpha}(\beta)=\beta-n \alpha$ for some $n \in \mathbb{Z}$. The group $W$ generated by the reflections $s_{\alpha}, \alpha \in \Sigma$, is the real finite reflection group of $\Sigma$.

## Definition

A subset $\Delta=\left\{\alpha_{1}, \ldots, \alpha_{n}\right\}$ of $\Sigma$ is a simple system of $\Sigma$ if it is an $\mathbb{R}$-basis of $V$, and if every root $\alpha \in \Sigma$ can be written as an $\mathbb{R}$-linear combination of elements in $\Delta$ with all coefficients nonnpositive or all coefficients nonnegative. We call $s_{\alpha_{i}}$ a simple reflection.

## Definition

A subset $\Delta=\left\{\alpha_{1}, \ldots, \alpha_{n}\right\}$ of $\Sigma$ is a simple system of $\Sigma$ if it is an $\mathbb{R}$-basis of $V$, and if every root $\alpha \in \Sigma$ can be written as an $\mathbb{R}$-linear combination of elements in $\Delta$ with all coefficients nonnpositive or all coefficients nonnegative. We call $s_{\alpha_{i}}$ a simple reflection.

Let $W$ be a real finite reflection group.

## Question

Can we find a root system $\Sigma$ in $V$ whose real finite reflection group is $W$, and a simple system $\Delta$ of $\Sigma$, such the following property holds?

## Definition

A subset $\Delta=\left\{\alpha_{1}, \ldots, \alpha_{n}\right\}$ of $\Sigma$ is a simple system of $\Sigma$ if it is an $\mathbb{R}$-basis of $V$, and if every root $\alpha \in \Sigma$ can be written as an $\mathbb{R}$-linear combination of elements in $\Delta$ with all coefficients nonnpositive or all coefficients nonnegative. We call $s_{\alpha_{i}}$ a simple reflection.

Let $W$ be a real finite reflection group.

## Question

Can we find a root system $\Sigma$ in $V$ whose real finite reflection group is $W$, and a simple system $\Delta$ of $\Sigma$, such the following property holds?

Let $\alpha \in \Sigma$ be any root. By definition of $\Delta$, there exist unique elements $c_{i}^{\alpha} \in \mathbb{R}$ such that $\alpha=c_{1}^{\alpha} \alpha_{1}+\cdots+c_{n}^{\alpha} \alpha_{n}$. Let $\mathcal{R}$ be the subring of $\mathbb{R}$ generated by the elements $c_{i}^{\alpha}$ over all $i=1, \ldots, n$ and $\alpha \in \Sigma$

## Property

The subring $\mathcal{R}$ a free finitely-generated $\mathbb{Z}$-module with a power basis (i.e., a basis of the form $\left\{1, \beta, \beta^{2}, \ldots, \beta^{\prime-1}\right\}, I \geqslant 1$, where $\beta \in \mathcal{R}$ ).

One can show that $\mathcal{R}$ is the unital subring of $\mathbb{R}$ generated by the elements $\alpha_{i}^{\vee}\left(\alpha_{j}\right):=2 \frac{\left(\alpha_{i}, \alpha_{j}\right)}{\left(\alpha_{i}, \alpha_{i}\right)}$ over all pairs of simple roots $\alpha_{i}, \alpha_{j} \in \Delta$.

One can show that $\mathcal{R}$ is the unital subring of $\mathbb{R}$ generated by the elements $\alpha_{i}^{\vee}\left(\alpha_{j}\right):=2 \frac{\left(\alpha_{i}, \alpha_{j}\right)}{\left(\alpha_{i}, \alpha_{i}\right)}$ over all pairs of simple roots $\alpha_{i}, \alpha_{j} \in \Delta$.

## Example

If $W$ is a Weyl group, we can choose $(\Sigma, \Delta)$ so that $\alpha_{i}^{\vee}\left(\alpha_{j}\right) \in \mathbb{Z}$. Thus, $\mathcal{R}=\mathbb{Z}$.

One can show that $\mathcal{R}$ is the unital subring of $\mathbb{R}$ generated by the elements $\alpha_{i}^{\vee}\left(\alpha_{j}\right):=2 \frac{\left(\alpha_{i}, \alpha_{j}\right)}{\left(\alpha_{i}, \alpha_{i}\right)}$ over all pairs of simple roots $\alpha_{i}, \alpha_{j} \in \Delta$.

## Example

If $W$ is a Weyl group, we can choose $(\Sigma, \Delta)$ so that $\alpha_{i}^{\vee}\left(\alpha_{j}\right) \in \mathbb{Z}$. Thus, $\mathcal{R}=\mathbb{Z}$.

## Example

If $W=I_{2}(m)$ is a dihedral group of order $2 m, m \geqslant 3$, then we can choose $(\Sigma, \Delta)$ such that $\mathcal{R}=\mathbb{Z}\left[2 \cos \left(\frac{\pi}{m}\right)\right]$.

One can show that $\mathcal{R}$ is the unital subring of $\mathbb{R}$ generated by the elements $\alpha_{i}^{\vee}\left(\alpha_{j}\right):=2 \frac{\left(\alpha_{i}, \alpha_{j}\right)}{\left(\alpha_{i}, \alpha_{i}\right)}$ over all pairs of simple roots $\alpha_{i}, \alpha_{j} \in \Delta$.

## Example

If $W$ is a Weyl group, we can choose $(\Sigma, \Delta)$ so that $\alpha_{i}^{\vee}\left(\alpha_{j}\right) \in \mathbb{Z}$. Thus, $\mathcal{R}=\mathbb{Z}$.

## Example

If $W=I_{2}(m)$ is a dihedral group of order $2 m, m \geqslant 3$, then we can choose $(\Sigma, \Delta)$ such that $\mathcal{R}=\mathbb{Z}\left[2 \cos \left(\frac{\pi}{m}\right)\right]$.

## Example

If $W=H_{3}$ or $W=H_{4}$, then we can choose $(\Sigma, \Delta)$ such that $\mathcal{R}=\mathbb{Z}[\tau]$, where $\tau=\frac{1+\sqrt{5}}{2}$ is the golden section. It is a root of $x^{2}-x-1$.

One can show that $\mathcal{R}$ is the unital subring of $\mathbb{R}$ generated by the elements $\alpha_{i}^{\vee}\left(\alpha_{j}\right):=2 \frac{\left(\alpha_{i}, \alpha_{j}\right)}{\left(\alpha_{i}, \alpha_{i}\right)}$ over all pairs of simple roots $\alpha_{i}, \alpha_{j} \in \Delta$.

## Example

If $W$ is a Weyl group, we can choose $(\Sigma, \Delta)$ so that $\alpha_{i}^{\vee}\left(\alpha_{j}\right) \in \mathbb{Z}$. Thus, $\mathcal{R}=\mathbb{Z}$.

## Example

If $W=I_{2}(m)$ is a dihedral group of order $2 m, m \geqslant 3$, then we can choose $(\Sigma, \Delta)$ such that $\mathcal{R}=\mathbb{Z}\left[2 \cos \left(\frac{\pi}{m}\right)\right]$.

## Example

If $W=H_{3}$ or $W=H_{4}$, then we can choose $(\Sigma, \Delta)$ such that $\mathcal{R}=\mathbb{Z}[\tau]$, where $\tau=\frac{1+\sqrt{5}}{2}$ is the golden section. It is a root of $x^{2}-x-1$.

## Definition

Fix a power basis $\left\{e_{i}\right\}$ of $\mathcal{R}$. Let $\Lambda$ be the $\mathcal{R}$-module generated $\Sigma$. Then $\Lambda$ is a free finitely-generated $\mathbb{Z}$-module with basis $\left\{e_{i} \alpha_{j}\right\}$.

## Formal group laws

## Definition

A one-dimensional commutative formal group law (FGL) $(R, F)$ over a commutative unital ring $R$ is a power series $F(u, v) \in R \llbracket u, v \rrbracket$ satisfying the following axioms:
(1) $F(u, 0)=F(0, u)=u \in R \llbracket u \rrbracket$;
(2) $F(u, v)=F(v, u)$;
(3) $F(u, F(v, w))=F(F(u, v), w) \in R \llbracket u, v, w \rrbracket$.

A morphism $f:(R, F) \rightarrow\left(R, F^{\prime}\right)$ of FGLs over $R$ is a power series $f(u) \in R \llbracket u \rrbracket$ such that $f(F(u, v))=F^{\prime}(f(u), f(v))$ and $f(0)=0$.

## Formal group laws

## Definition

A one-dimensional commutative formal group law (FGL) $(R, F)$ over a commutative unital ring $R$ is a power series $F(u, v) \in R \llbracket u, v \rrbracket$ satisfying the following axioms:
(1) $F(u, 0)=F(0, u)=u \in R \llbracket u \rrbracket$;
(2) $F(u, v)=F(v, u)$;
(3) $F(u, F(v, w))=F(F(u, v), w) \in R \llbracket u, v, w \rrbracket$.

A morphism $f:(R, F) \rightarrow\left(R, F^{\prime}\right)$ of FGLs over $R$ is a power series $f(u) \in R \llbracket u \rrbracket$ such that $f(F(u, v))=F^{\prime}(f(u), f(v))$ and $f(0)=0$.

Let $(\mathbb{C}, F)$ be an $\operatorname{FGL}$. Suppose $\left(\mathbb{C}, F_{a}\right)$ is the additive formal group law over $\mathbb{C}$, i.e., $F_{a}(u, v)=u+v$. There are isomorphisms of FGLs $\log _{F}:(\mathbb{C}, F) \rightarrow\left(\mathbb{C}, F_{a}\right)$ and $\exp _{F}:\left(\mathbb{C}, F_{a}\right) \rightarrow(\mathbb{C}, F)$ called the logarithm and exponential of $(\mathbb{C}, F)$, i.e., $\exp _{F}\left(\log _{F}(u)\right)=\log _{F}\left(\exp _{F}(u)\right)=u$.

## Definition

Let $R$ be a subring of $\mathbb{C}$ containing the coefficients in the series $F(u, v)$ and the coefficients in the logarithm and exponential of $(\mathbb{C}, F)$. We call $R$ an ample ring with respect to ( $C, F$ ). Thus, we can view $(R, F)$ as a formal group law with a logarithm and exponetial.

## Definition

Let $R$ be a subring of $\mathbb{C}$ containing the coefficients in the series $F(u, v)$ and the coefficients in the logarithm and exponential of $(\mathbb{C}, F)$. We call $R$ an ample ring with respect to $(\mathbb{C}, F)$. Thus, we can view $(R, F)$ as a formal group law with a logarithm and exponetial.

## Example

The additive FGL $\left(R, F_{a}\right)$ over $R$ is $F_{a}(x, y)=x+y$. If $R$ is an ample ring with respect to ( $\mathbb{C}, F_{a}$ ), then the logarithm of $\left(R, F_{a}\right)$ is $\log _{F_{a}}(x)=x$, and the exponential of $\left(R, F_{a}\right)$ is $\exp _{F_{a}}(x)=x$.

## Definition

Let $R$ be a subring of $\mathbb{C}$ containing the coefficients in the series $F(u, v)$ and the coefficients in the logarithm and exponential of $(\mathbb{C}, F)$. We call $R$ an ample ring with respect to ( $C, F$ ). Thus, we can view $(R, F)$ as a formal group law with a logarithm and exponetial.

## Example

The additive FGL $\left(R, F_{a}\right)$ over $R$ is $F_{a}(x, y)=x+y$. If $R$ is an ample ring with respect to $\left(\mathbb{C}, F_{a}\right)$, then the logarithm of $\left(R, F_{a}\right)$ is $\log _{F_{a}}(x)=x$, and the exponential of $\left(R, F_{a}\right)$ is $\exp _{F_{a}}(x)=x$.

## Example

The multiplicative FGL $\left(R, F_{m}\right)$ over $R$ is $F_{m}(x, y)=x+y+x y$.
If $R$ is an ample ring with respect to ( $\mathbb{C}, F_{m}$ ), then the logarithm and exponential series of $\left(R, F_{m}\right)$ are given by the formulas

$$
\log _{F_{m}}(x)=\log (1+x)=\sum_{i \geqslant 1}(-1)^{i-1 \frac{x^{i}}{i} ; \quad \exp _{F_{m}}(x)=\exp (x)-1=\sum_{i \geqslant 1} \frac{x^{i}}{i!} . . . ~ . ~}
$$

## Formal group ring

## Assumption

If $\Sigma$ is noncrystallographic, then $R$ is an ample ring with respect to an FGL ( $\mathbb{C}, F$ ), such that $R$ contains $\mathcal{R}$. If $\Sigma$ is crystallographic, then $R$ is a subring of $C$, and $(R, F)$ is an FGL.

## Formal group ring

## Assumption

If $\Sigma$ is noncrystallographic, then $R$ is an ample ring with respect to an FGL ( $C, F$ ), such that $R$ contains $\mathcal{R}$. If $\Sigma$ is crystallographic, then $R$ is a subring of $\mathbb{C}$, and ( $R, F$ ) is an FGL.

## Definition

Set $R \llbracket x_{\wedge} \rrbracket:=R \llbracket x_{\lambda} \rrbracket_{\lambda \in \Lambda}$, and let

$$
f_{i, j}= \begin{cases}e_{i} \log _{F}\left(x_{\alpha_{j}}\right)-\log _{F}\left(x_{e_{i} \alpha_{j}}\right), & \Sigma \text { noncrystallographic } ; \\ 0, & \Sigma \text { crystallographic. }\end{cases}
$$

Let $\mathcal{J}_{F}$ be the closure of the ideal in $R \llbracket x_{\wedge} \rrbracket$ generated by
$x_{0}$ and $x_{\lambda_{1}+\lambda_{2}}-\left(x_{\lambda_{1}+F} x_{\lambda_{2}}\right)$ and $f_{i, j} ; \quad \lambda_{1}, \lambda_{2} \in \Lambda ; e_{i} \in B ; \alpha_{j} \in \Delta$.
The quotient $R \llbracket \Lambda \rrbracket_{F}:=R \llbracket x_{\Lambda} \rrbracket_{F} / \mathcal{J}_{F}$ is the formal group ring.

## Example

Let $S_{R}^{i}(\Lambda)$ be the $i$-th symmetric power of the $R$-module $R \otimes_{\mathcal{R}} \Lambda$, and set $\left(S_{R}^{*}(\Lambda)\right)^{\wedge}:=\prod_{i=0}^{\infty} S_{R}^{i}(\Lambda)$. There is an $R$-algebra isomorphism

$$
R \llbracket \Lambda \rrbracket_{F_{\mathrm{a}}} \simeq\left(S_{R}^{*}(\Lambda)\right)^{\wedge} .
$$

## Example

Let $S_{R}^{i}(\Lambda)$ be the $i$-th symmetric power of the $R$-module $R \otimes_{\mathcal{R}} \Lambda$, and set $\left(S_{R}^{*}(\Lambda)\right)^{\wedge}:=\prod_{i=0}^{\infty} S_{R}^{i}(\Lambda)$. There is an $R$-algebra isomorphism

$$
R \llbracket \Lambda \rrbracket_{F_{\mathrm{a}}} \simeq\left(S_{R}^{*}(\Lambda)\right)^{\wedge} .
$$

## Proposition

The following properties hold in $R \llbracket \Lambda \rrbracket_{F}$ :
(1) There is a well-defined $W$-action on $R \llbracket \Lambda \rrbracket_{F}$ given by $w\left(x_{\lambda}\right)=x_{w(\lambda)}$.
(2) $R \llbracket \Lambda \rrbracket_{F}$ is an integral domain.
(3) $x_{\alpha_{j}}$ divides $x_{e_{i} \alpha_{j}}$ in $R \llbracket \Lambda \rrbracket_{F}$ for all $e_{i} \in B$ and $\alpha_{j} \in \Delta$.

## Example

Let $S_{R}^{i}(\Lambda)$ be the $i$-th symmetric power of the $R$-module $R \otimes_{\mathcal{R}} \Lambda$, and set $\left(S_{R}^{*}(\Lambda)\right)^{\wedge}:=\prod_{i=0}^{\infty} S_{R}^{i}(\Lambda)$. There is an $R$-algebra isomorphism

$$
R \llbracket \Lambda \rrbracket_{F_{\mathrm{a}}} \simeq\left(S_{R}^{*}(\Lambda)\right)^{\wedge}
$$

## Proposition

The following properties hold in $R \llbracket \Lambda \rrbracket_{F}$ :
(1) There is a well-defined $W$-action on $R \llbracket \Lambda \rrbracket_{F}$ given by $w\left(x_{\lambda}\right)=x_{w(\lambda)}$.
(2) $R \llbracket \Lambda \rrbracket_{F}$ is an integral domain.
(3) $x_{\alpha_{j}}$ divides $x_{e_{i} \alpha_{j}}$ in $R \llbracket \Lambda \rrbracket_{F}$ for all $e_{i} \in B$ and $\alpha_{j} \in \Delta$.

## Corollary

For any $u \in R \llbracket \Lambda \rrbracket_{F}$ and root $\alpha \in \Sigma$, the element $u-s_{\alpha}(u)$ is divisible by $x_{\alpha}$ in $R \llbracket \Lambda \rrbracket_{F}$.

## Formal Demazure operators

## Definition

For each root $\alpha \in \Sigma$, we define a formal Demazure operator $\Delta_{\alpha}$ on $R \llbracket \Lambda \rrbracket_{F}$ by the formula

$$
\Delta_{\alpha}(u)=\frac{u-s_{\alpha}(u)}{x_{\alpha}}, \quad u \in R \llbracket \Lambda \rrbracket_{F}
$$

We set $\Delta_{i}:=\Delta_{\alpha_{i}}$ for $\alpha_{i} \in \Delta$.

## Formal Demazure operators

## Definition

For each root $\alpha \in \Sigma$, we define a formal Demazure operator $\Delta_{\alpha}$ on $R \llbracket \Lambda \rrbracket_{F}$ by the formula

$$
\Delta_{\alpha}(u)=\frac{u-s_{\alpha}(u)}{x_{\alpha}}, \quad u \in R \llbracket \Lambda \rrbracket_{F} .
$$

We set $\Delta_{i}:=\Delta_{\alpha_{i}}$ for $\alpha_{i} \in \Delta$.

## Definition

Let $\mathcal{D}_{(R, F)}(\Lambda)$ be the subalgebra of $R$-linear endomorphisms of $R \llbracket \Lambda \rrbracket_{F}$ generated by the formal Demazure operators $\Delta_{\alpha}$ for all roots $\alpha$, and by multiplication by elements of $R \llbracket \Lambda \rrbracket_{F}$.

Given $q \in R \llbracket \Lambda \rrbracket_{F}$, let $q^{*}$ be the corresponding multiplication operator in $\mathcal{D}_{F}$. Given $w \in W$, let $w=s_{i_{1}} \cdots s_{i_{r}}$ be a reduce decomposition of $w$. We call $I_{w}:=\left(\alpha_{i_{1}}, \ldots, \alpha_{i_{r}}\right)$ a reduced sequence of $w$. Fix reduced sequences $\left\{I_{w}\right\}_{w \in W}$, and set $\Delta_{I_{w}}:=\Delta_{i_{1}} \circ \cdots \circ \Delta_{i_{r}}$, if $I_{w}:=\left(\alpha_{i_{1}}, \ldots, \alpha_{i_{r}}\right)$.

Given $q \in R \llbracket \wedge \rrbracket_{F}$, let $q^{*}$ be the corresponding multiplication operator in $\mathcal{D}_{F}$. Given $w \in W$, let $w=s_{i_{1}} \cdots s_{i_{r}}$ be a reduce decomposition of $w$. We call $I_{w}:=\left(\alpha_{i_{1}}, \ldots, \alpha_{i_{r}}\right)$ a reduced sequence of $w$. Fix reduced sequences $\left\{I_{w}\right\}_{w \in W}$, and set $\Delta_{I_{w}}:=\Delta_{i_{1}} \circ \cdots \circ \Delta_{i_{r}}$, if $I_{w}:=\left(\alpha_{i_{1}}, \ldots, \alpha_{i_{r}}\right)$.

## Theorem

The elements $q^{*} \in R \llbracket \Lambda \rrbracket_{F}$ and the formal Demazure operators $\Delta_{i}=\Delta_{\alpha_{i}}$, where $\alpha_{i} \in \Delta$, satisfy the following relations:
(1) $\Delta_{i} \circ q^{*}=\Delta_{i}(q)+\left(s_{i}(q)\right)^{*} \circ \Delta_{i}$;
(2) $\Delta_{i}^{2}=\kappa_{i}^{*} \circ \Delta_{i}$, where $\kappa_{i}:=\frac{1}{x_{\alpha_{i}}}+\frac{1}{x_{-\alpha_{i}}} \in R \llbracket \Lambda \rrbracket_{F}$;
(3) $\underbrace{\Delta_{i} \circ \Delta_{j} \circ \Delta_{i} \cdots}_{m_{i, j} \text {-times }}-\underbrace{\Delta_{j} \circ \Delta_{i} \circ \Delta_{j} \cdots}_{m_{i, j} \text {-times }}=\sum_{w<w_{0}^{i, j}}\left(\kappa_{i, j}^{w}\right)^{*} \circ \Delta_{l_{w}}, \quad \kappa_{i, j}^{w} \in R \llbracket \Lambda \rrbracket_{F}$.

Here $w_{0}^{i, j}:=\underbrace{s_{i} s_{i} s_{i} \cdots}_{m_{i j}-\text { times }}$, and the ordering $<$ is with respect to the Bruhat
order on $W$. These relations, together with the ring law in $R \llbracket \Lambda \rrbracket_{F}$ and the fact that the $\Delta_{i}$ are $R$-linear form a complete set of relations in $\mathcal{D}_{F}$.

Set $y_{i}:=\frac{1}{x_{\alpha_{i}}}$ and $s_{i, j, \ldots}^{(k)}:=\underbrace{s_{i} s_{j} s_{i} \cdots}_{k \text {-times }}$ and $\Delta_{i, j, \ldots}^{(k)}:=\underbrace{\Delta_{i} \circ \Delta_{j} \circ \Delta_{i} \cdots}_{k \text {-times }}$, for $k \geqslant 0$.
For $k_{1} \leqslant k_{2}$, define the operator

$$
s_{i, j}^{\left(k_{1}, k_{2}\right)}(u):=s_{i, j, \ldots}^{\left(k_{1}\right)}(u)+s_{i, j, \ldots}^{\left(k_{1}+1\right)}(u)+\cdots+s_{i, j, \ldots}^{\left(k_{2}\right)}(u) .
$$

Set $y_{i}:=\frac{1}{x_{\alpha_{i}}}$ and $s_{i, j, \ldots}^{(k)}:=\underbrace{s_{i} s_{j} s_{i} \cdots}_{k \text {-times }}$ and $\Delta_{i, j, \ldots}^{(k)}:=\underbrace{\Delta_{i} \circ \Delta_{j} \circ \Delta_{i} \cdots}_{k \text {-times }}$, for $k \geqslant 0$.
For $k_{1} \leqslant k_{2}$, define the operator

$$
s_{i, j}^{\left(k_{1}, k_{2}\right)}(u):=s_{i, j, \ldots}^{\left(k_{1}\right)}(u)+s_{i, j, \ldots}^{\left(k_{1}+1\right)}(u)+\cdots+s_{i, j, \ldots}^{\left(k_{2}\right)}(u) .
$$

## Corollary

The difference $\Delta_{i, j, \ldots}^{\left(m_{i, \ldots}\right)}-\Delta_{j, i, \ldots}^{\left(m_{i, j}\right)}$ can be written as a linear combination

$$
\Delta_{i, j, \ldots}^{\left(m_{i, j}\right)}-\Delta_{j, i, \ldots}^{\left(m_{i, j}\right)}=\sum_{k=1}^{m_{i, j}-2}\left(\kappa_{i, j}^{(k)} \Delta_{i, j, \ldots}^{(k)}-\kappa_{j, i}^{(k)} \Delta_{j, i, \ldots}^{(k)}\right), \quad \kappa_{i, j}^{(k)} \in R \llbracket \Lambda \rrbracket_{F} .
$$

For odd $m_{i, j}$ :

$$
\begin{gathered}
\kappa_{j, i}^{\left(m_{i, j}-2\right)}=s_{j, i}^{\left(0, m_{i, j}-2\right)}\left(y_{i} y_{j}\right)-y_{i} s_{j, i, \ldots}^{\left(m_{i, j}-2\right)}\left(y_{i}\right) ; \\
\kappa_{i, j}^{\left(m_{i, j}-3\right)}=-y_{j}\left\{s_{i}\left(y_{i} y_{j}\right)+\left[s_{i, j}^{\left(2, m_{i, j}-3\right)}-s_{j, i}^{\left(2, m_{i, j}-3\right)}\right]\left(y_{i} y_{j}\right)\right. \\
\left.-s_{j, i, \ldots}^{\left(m_{i, \ldots}-2\right)}\left(y_{i} y_{j}\right)+y_{i} s_{j, i, \ldots}^{\left(m_{i, j}-2\right)}\left(y_{i}\right)-s_{i, j, \ldots}^{\left(m_{i, j}-3\right)}\left(y_{i}\right) s_{i, j, \ldots}^{\left(m_{i, j}-2\right)}\left(y_{j}\right)\right\} .
\end{gathered}
$$
